Fixed Implant Bridge*

Consultation and Treatment Planning
Discuss treatment goals and process, take diagnostic scans and present your treatment plan.

Placing Your Dental Implants
Dental implant surgery involves removing any unwanted teeth and placing dental implants into your jaw bone.

Healing Phase
The implants may be left for 3-6 months to heal. During this time you will wear temporary teeth

Designing Your New Teeth
Digital scans are taken of your mouth and implants. Our specialist lab designs your new teeth

Try-In of Your New Smile
We will try-in your new teeth to check the fit, aesthetics, bite and speech and make any necessary adjustments.

Fitting Your Bridge
Your long-term bridge connected to your dental implants.

Maintaining Your Smile
Six months after your new bridge is fitted, we review treatment and professionally clean your implant bridge.

*Small bridges follow the same process as single implants.
